

ResumelQ AI

Project Manifesto & Technical Whitepaper

Bridging the gap between job seekers and Applicant Tracking Systems. An analytical deep-dive into semantic AI document parsing, weighted matching dimensions, and candidate data privacy constraints.

AUTHOR: DEBANJANA

June 2026 | Version 1.0.0 (Production) | Gemini 2.5 Flash & unpdf

Executive Summary:

ResumelQ AI is a high-performance, database-less SaaS utility designed to bypass the artificial friction of modern candidate screening. By replacing legacy keyword-matching algorithms with context-aware semantic parsing powered by Google's Gemini 2.5 Flash, the tool provides objective score breakdowns. It enforces candidate privacy by processing all resume uploads entirely in-memory on the server, ensuring zero data persistence and immediate memory cleanup upon analysis completion.

1. The Problem Space

The application phase of modern recruitment has become heavily automated, creating structural friction between candidates and decision-makers. In analyzing this friction, we identified three core architectural flaws governing current processes.

1.1 The "Black Hole" of Job Applications

More than **75% of resumes** submitted to mid-to-large-size organizations are filtered out by Applicant Tracking Systems (ATS) before a human recruiter ever sees them. Candidates submit applications into what feels like a digital black hole, receiving automated rejection emails with zero feedback or guidance on why their profile was discounted.

1.2 The Flaw of Traditional Online ATS Checkers

Commercial resume checkers (such as Jobscan or Resume Worded) attempt to solve this problem by providing simple keyword density scores. They count how many times exact characters match. For instance, if a job description lists *'team leadership'* and a candidate writes *'led a team of software engineers,'* a standard checker flags the skill as missing. This forces candidates to write robotic, keyword-stuffed resumes that look unnatural and unappealing to the human eye once they reach the interview stage.

1.3 Data Harvesting and Privacy Violations

Standard online checkers operate as lead-generation engines. They require users to create accounts, input names, emails, and phone numbers, and upload full resumes to cloud databases. These databases are later sold to recruiters or monetized via high-priced resume-writing referrals. Candidate data privacy is routinely compromised.

2. The ResumelQ Philosophy & Solution

ResumelQ AI rejects the current trade-off. We believe that resumes should remain human, readable, and metrics-driven, while meeting the technical expectations of database systems.

2.1 Context and Semantics Over Keywords

ResumelQ utilizes Google's **Gemini 2.5 Flash** large language model to parse text semantically. Instead of looking for exact characters, it evaluates matching concepts. It recognizes technical hierarchies, synonyms, and development frameworks, giving candidates credit for their actual competency, regardless of wording.

2.2 Zero Retention and In-Memory Execution

ResumelQ is built on a strict ****no-signup, database-less architecture****. Resume files are parsed and evaluated entirely in volatile server RAM. Files are never saved to disk, uploaded to cloud storage buckets, or stored in database tables. The moment the user closes the tab, all records are permanently cleared, ensuring absolute personal security.

3. Algorithmic Architecture & Weights

The overall ATS score is a weighted index calculated from six distinct evaluative dimensions. This ensures a comprehensive and realistic estimation of recruiter filters.

Evaluation Dimension	Weight	Focus Area
Keyword Match	30%	Semantic alignment of core tools, concepts, and requirements.
Skills Alignment	20%	Density of technical hard skills and key soft competencies.
Experience Relevance	20%	Seniority level, role responsibilities, and past job titles.
ATS Formatting	15%	Detecting layout blockers (text boxes, multi-columns, images).
Project Impact	10%	Percentage of bullet points containing quantitative metrics.
Readability Score	5%	Sentence structures, spacing, flow, grammar, and tone.

4. Technical Implementation & Data Flow

The architecture is designed to run in a lightweight Node.js Serverless environment:

- **Next.js App Router:** Renders the consolidated single-page application framework.
- **unpdf:** Reads binary PDF documents in volatile RAM without loading canvas dependencies.
- **Mammoth:** Extracts raw paragraphs from Microsoft Word (.docx) formats.
- **Gemini 2.5 Flash:** Runs semantic evaluations using JSON schema outputs in under 4 seconds.

4.1 In-Memory Data Flow Pipeline

5. Creator's Vision & Manifesto

"Applying for a job shouldn't be about trying to beat a broken parser by filling your resume with invisible text or robotic formatting. A resume is a story of personal growth, engineering achievements, and hard-earned expertise. ResumeIQ was designed to give candidates a fair screen—allowing them to speak like humans while verifying they check all the structural boxes standard screening machines require. Building a database-less model ensures our users focus purely on their next career leap, knowing their private information remains entirely theirs."

Core Pillars of ResumeIQ AI:

1. **Candidate First:** Designing tools to help developers, not exploit them.
2. **True Privacy:** No databases, no storage, no trackers.
3. **Actionable Insight:** Exact X-Y-Z formula rewrites instead of generic keyword checklists.
